## ABSTRACT

This report provides a detailed imagery-derived analysis of the Nan Chung Petroleum Refinery, China, from January 1963 to June 1969.

The refinery appeared to be operating when first seen in June 1963 and on all subsequent photography. Products include gasoline, kerosene, diesel and fuel oils, and residuum.

The report includes a detailed line drawing, a photograph of the refinery, mensuration of the storage facilities, a discussion of physical features and operational functions, a construction chronology, and reference data.

### INTRODUCTION

The Nan Chung Petroleum Refinery is located in the Szechwan Basin, Szechwan Province, 2 nautical miles (nm) north-northeast of Nan Chung and approximately 105 nm east of Cheng-tu. The refinery is in an agricultural area on the flood plain of the Chia-ling River.

Crude oil for charging the refinery is probably brought in from the Szechwan Basin oil fields by truck. Products and crude oil in excess of that used locally are probably transported by barge from the Nan Chung area. A small transshipment facility is located on the river 1 nm south-east of the refinery. No pipeline or rail line has been constructed to the Nan Chung area. The nearest points of access to rail facilities are at Chung-ching 80 nm to the south, and at Cheng-tu about 105 nm to the west.

The Nan Chung Thermal Power Plant Refinery [ ] is collocated with and furnishes electric power and steam to the refinery.

25X1

### BASIC DESCRIPTION

#### Physical Features

The refinery area measures approximately 1,800 by 1,500 feet, is irregularly shaped, and occupies approximately 65 acres. It is secured by a wall.

#### Operation Functions

The major products are refined petroleum products, primarily gasoline, kerosene, diesel and fuel oils, and residuum. The residuum is probably used for fuel in the pipe furnaces, as reserve fuel at the thermal power plant, and for road surface treatment.

#### Construction Status and Activity

January 1963 -- The basic refinery components including the crude distillation unit, the secondary processing units, the thermal power plant, and several products storage tanks were present. The refinery appeared to be in production and the power plant spray pond was in operation.

June 1963 -- One covered crude oil storage reservoir and an open water pond had been added. The spray pond at the thermal power plant appeared to be in use.

May 1966 -- The following significant expansion was apparent: the addition of two open water ponds in the crude oil storage area; 30 cylindrical tanks, one piece of U/I processing equipment, and one pumphouse in

the intermediates storage area; 13 buildings, eight cylindrical tanks and two horizontal tanks in the packaging and shipping area; 12 buildings in the maintenance and support area; and four cylindrical tanks in the products storage area. The plant appeared to be in production and the power plant spray pond was in operation.

August 1968 -- Two additional warehouses had been built in the maintenance and support area, and a large area of unidentified material was in open storage next to the larger storage building in the products storage area. The refinery appeared to be active.

January 1969 -- A heavy haze prohibited a detailed analysis, but the spray pond was in use, indicating that the refinery was probably in operation.

June 1969 -- Two cylindrical crude oil storage tanks had been built in the crude oil storage area. The refinery appeared to be in operation.

#### Facilities and Equipment

The following table lists the functional areas and equipment within the refinery. All items are keyed to Figure 3.

#### EQUIPMENT AND FACILITIES AT THE NAN CHUNG PETROLEUM REFINERY

<u>Area</u>	<u>Description</u>	<u>Equipment</u>
A	Crude Oil Storage	3 irregularly shaped water ponds 2 rectangular water treatment ponds 3 pumphouses 7 covered crude oil reservoirs each measure <input type="text"/> 4 cylindrical tanks <input type="text"/>
